

## **Web Appendix**

to the paper

### **Determinants of Economic Growth: Will Data Tell?**

by Antonio Ciccone and Marek Jarocinski

30 September 2009

downloadable from: [www.antonioiciccone.eu](http://www.antonioiciccone.eu)

**PART C:** Additional results on 1960-1996 growth determinants using income data from Penn World Table versions 6.2, 6.1, and 6.0

Results in sections 1-4 are generated with Ox programs available at [www.antonioiciccone.eu](http://www.antonioiciccone.eu) and results in section 5 are generated with the fortran programs accompanying the Ley and Steel (2009) paper available from the Journal of Applied Econometrics webpage.

The Ox programs use the importance sampling algorithm described in the Appendix of the SDM paper available from the American Economic Review website. All reported results are based on 100 million draws, although the SDM convergence criterion is satisfied in all cases after 26 to 95 million draws. We also verified that repeated simulations with different seeds produced very similar results.

The fortran programs of Ley and Steel use default simulation length and seed. The correlation between model visit frequencies and exact posterior odds was in all cases above 0.99, indicating convergence. All results in section 2 were generated using both the Ley and Steel programs and Ox programs and the results were very similar (Ley and Steel programs are much faster).

## 1. Results with the SDM approach

**Table C.1.1-SDM:** Posterior inclusion probabilities of individual variables – see Table 2 in the paper.

**Table C.1.2-SDM:** Posterior inclusion probabilities of groups of variables – see Table 4 in the paper.

**Table C.1.3-SDM:** Standardized unconditional posterior mean effects on growth

	PWT6.2	PWT6.1	PWT6.0	PWT6.2/6.1	PWT6.2/6.0

## 5. Results with the Ley and Steel (2009) hierarchical prior

The settings are  $g=1/K^2$  and a random  $\theta$  with a beta prior with expected model size  $N/2=33.5$ , which is the preferred specification in Ley and Steel (2009).
